Machine Learning Session One
Agenda

Introduction to ML

ML Lifecycle
Exploratory Data Analysis

Feature Selection

Feature Engineering

Model Selection and Creation

Evaluation Metrics
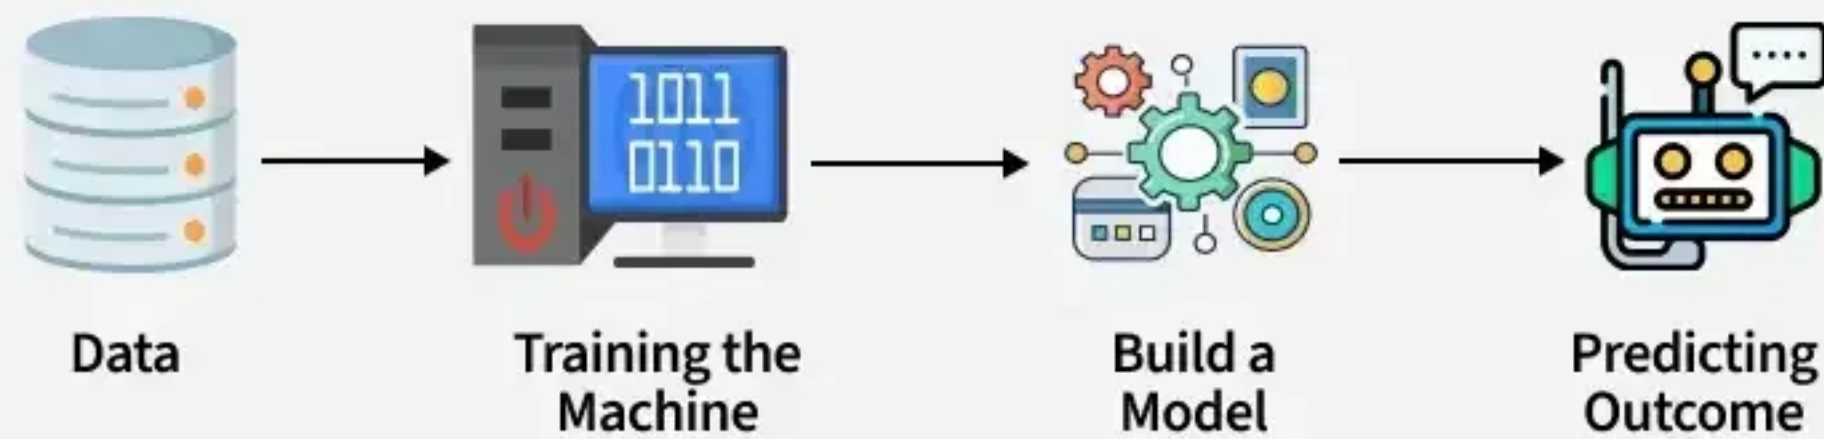

Overfitting and Underfitting Problem

AI, ML, DL and GI – How it all fits together!

Data Analytics
Artificial Intelligence
Machine Learning
Deep Learning
Generative Intelligence

Introduction to ML

Introduction To Machine Learning

Data → Training the Machine → Build a Model → Predicting Outcome

Machine Learning (ML) allow computers to learn and make decisions without being explicitly programmed

Example:

1. Netflix

2. Gmail

3. Siri/Alexa

4. Self Driving Cars

Does This Mean Machine is Actually Learning

Machine Learning Involves Algorithms that allow the machine to find patterns in data, make predictions, or take actions based on the data it has been given
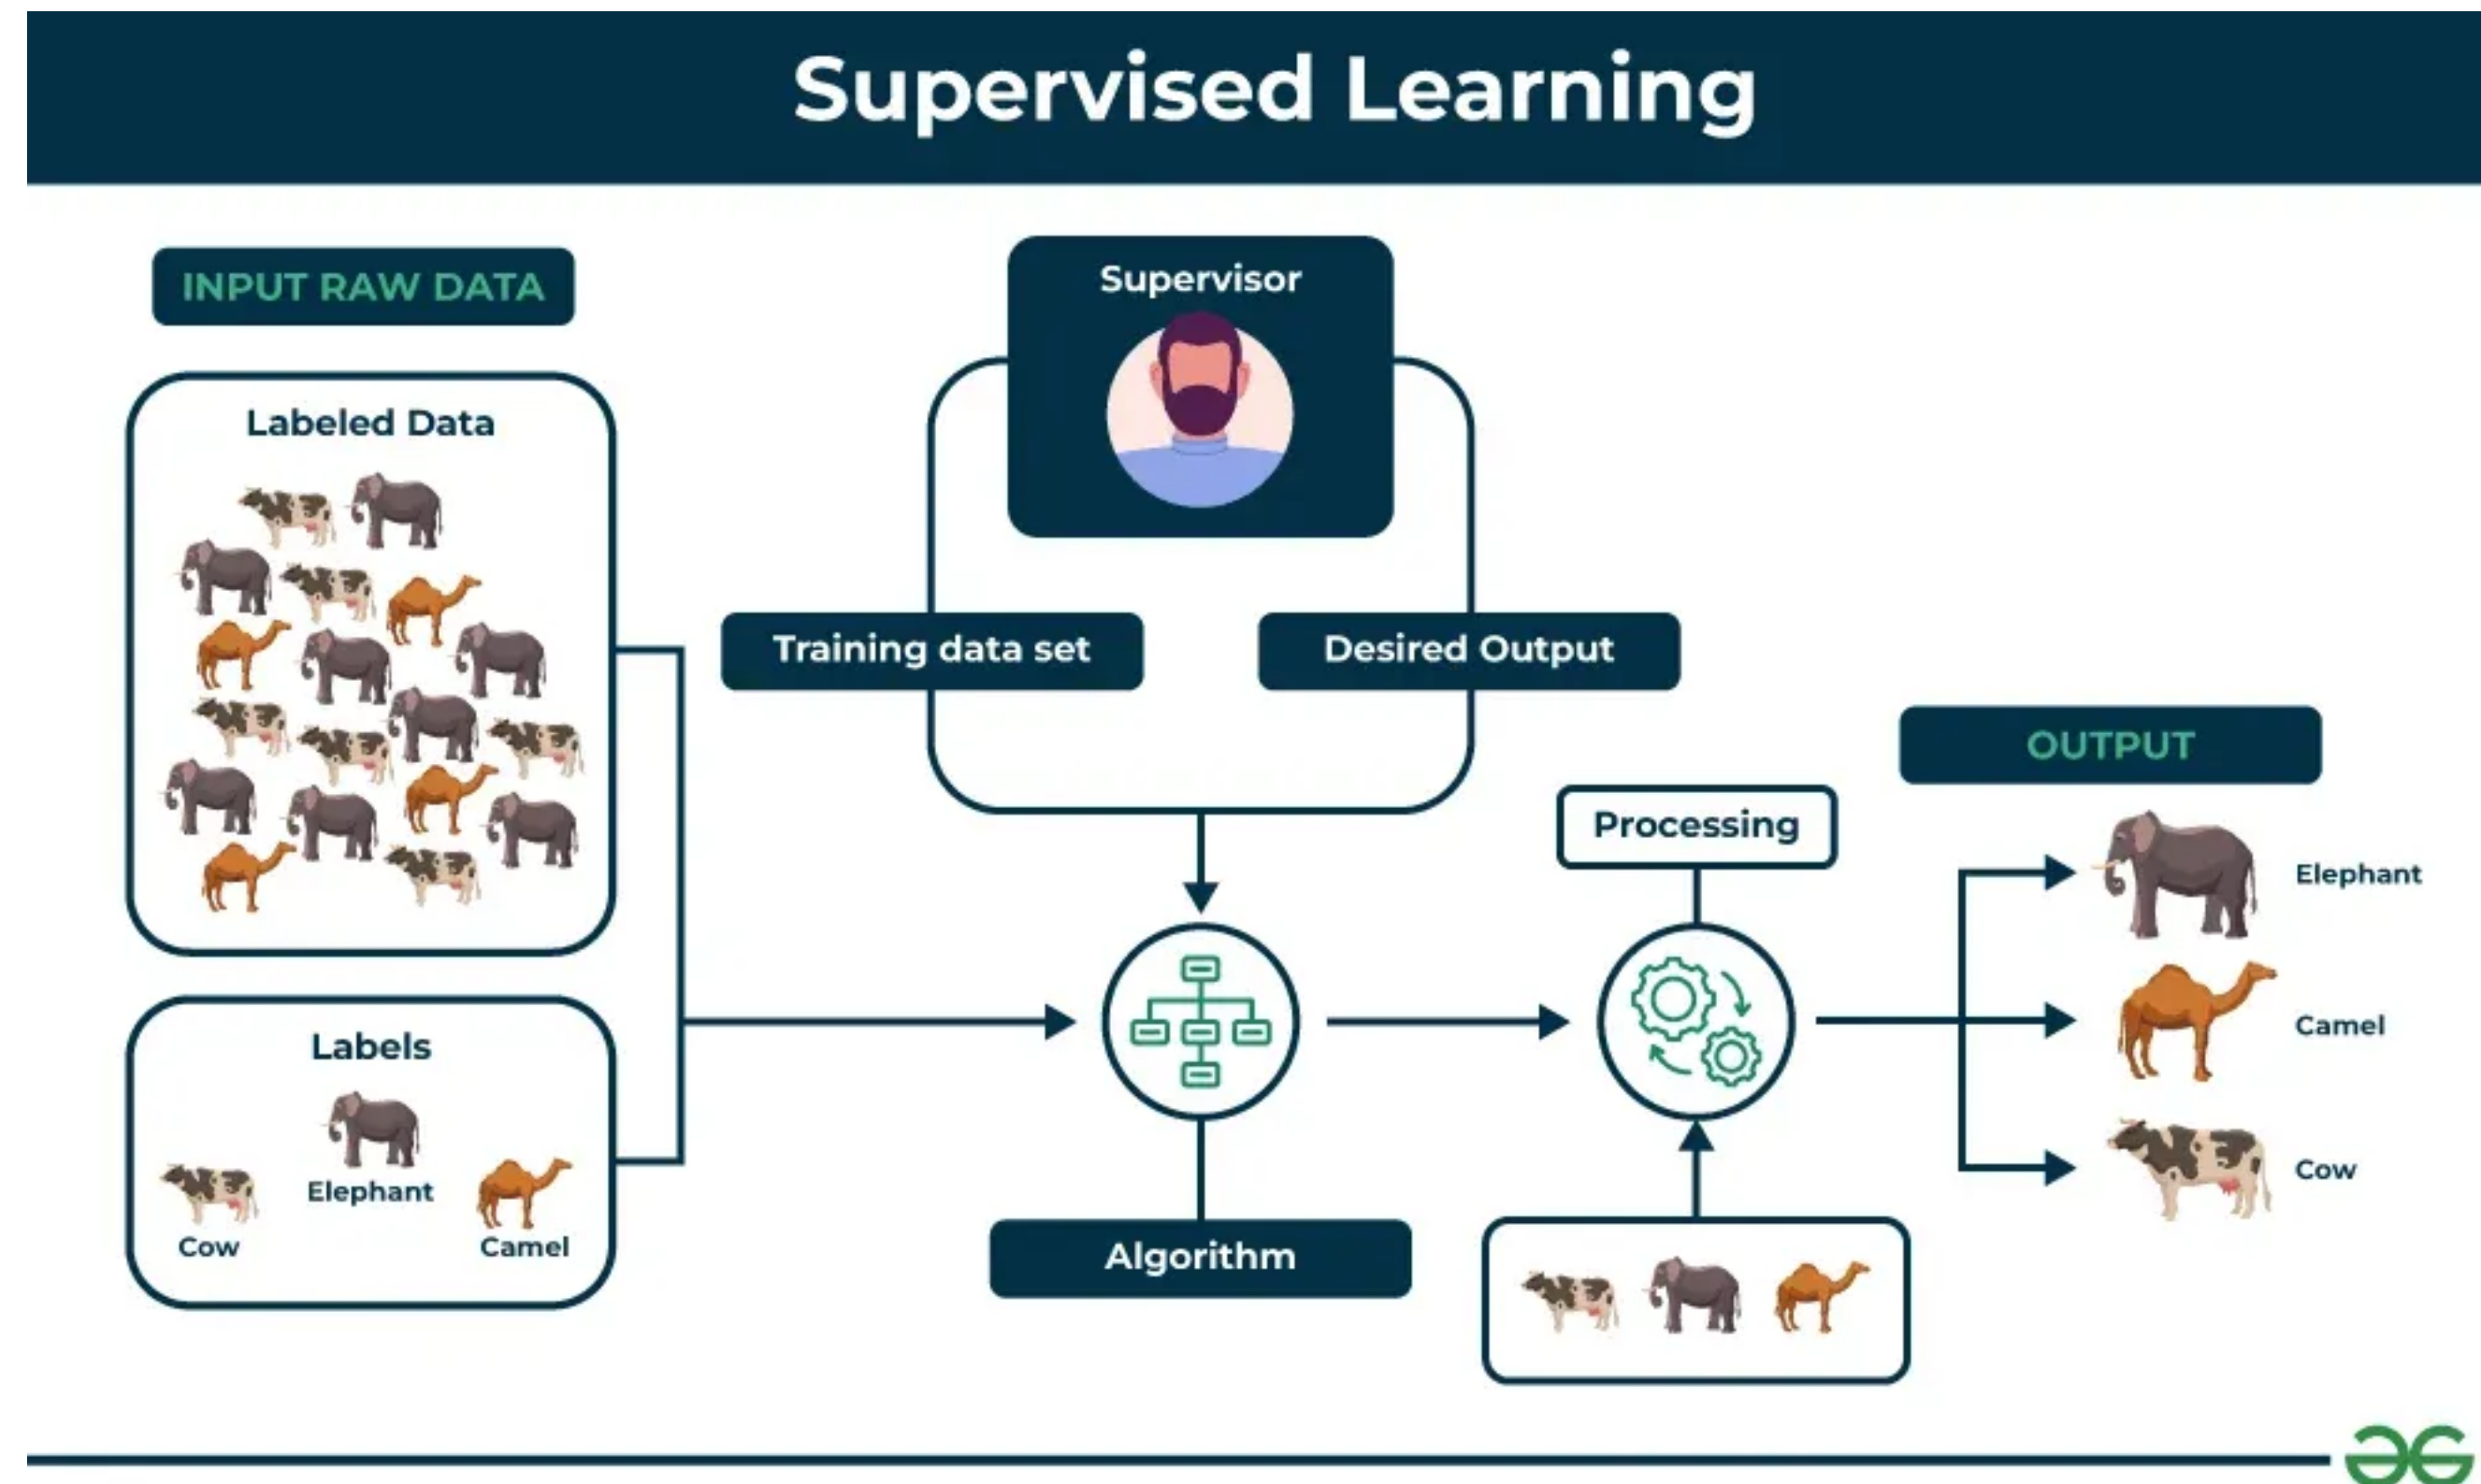

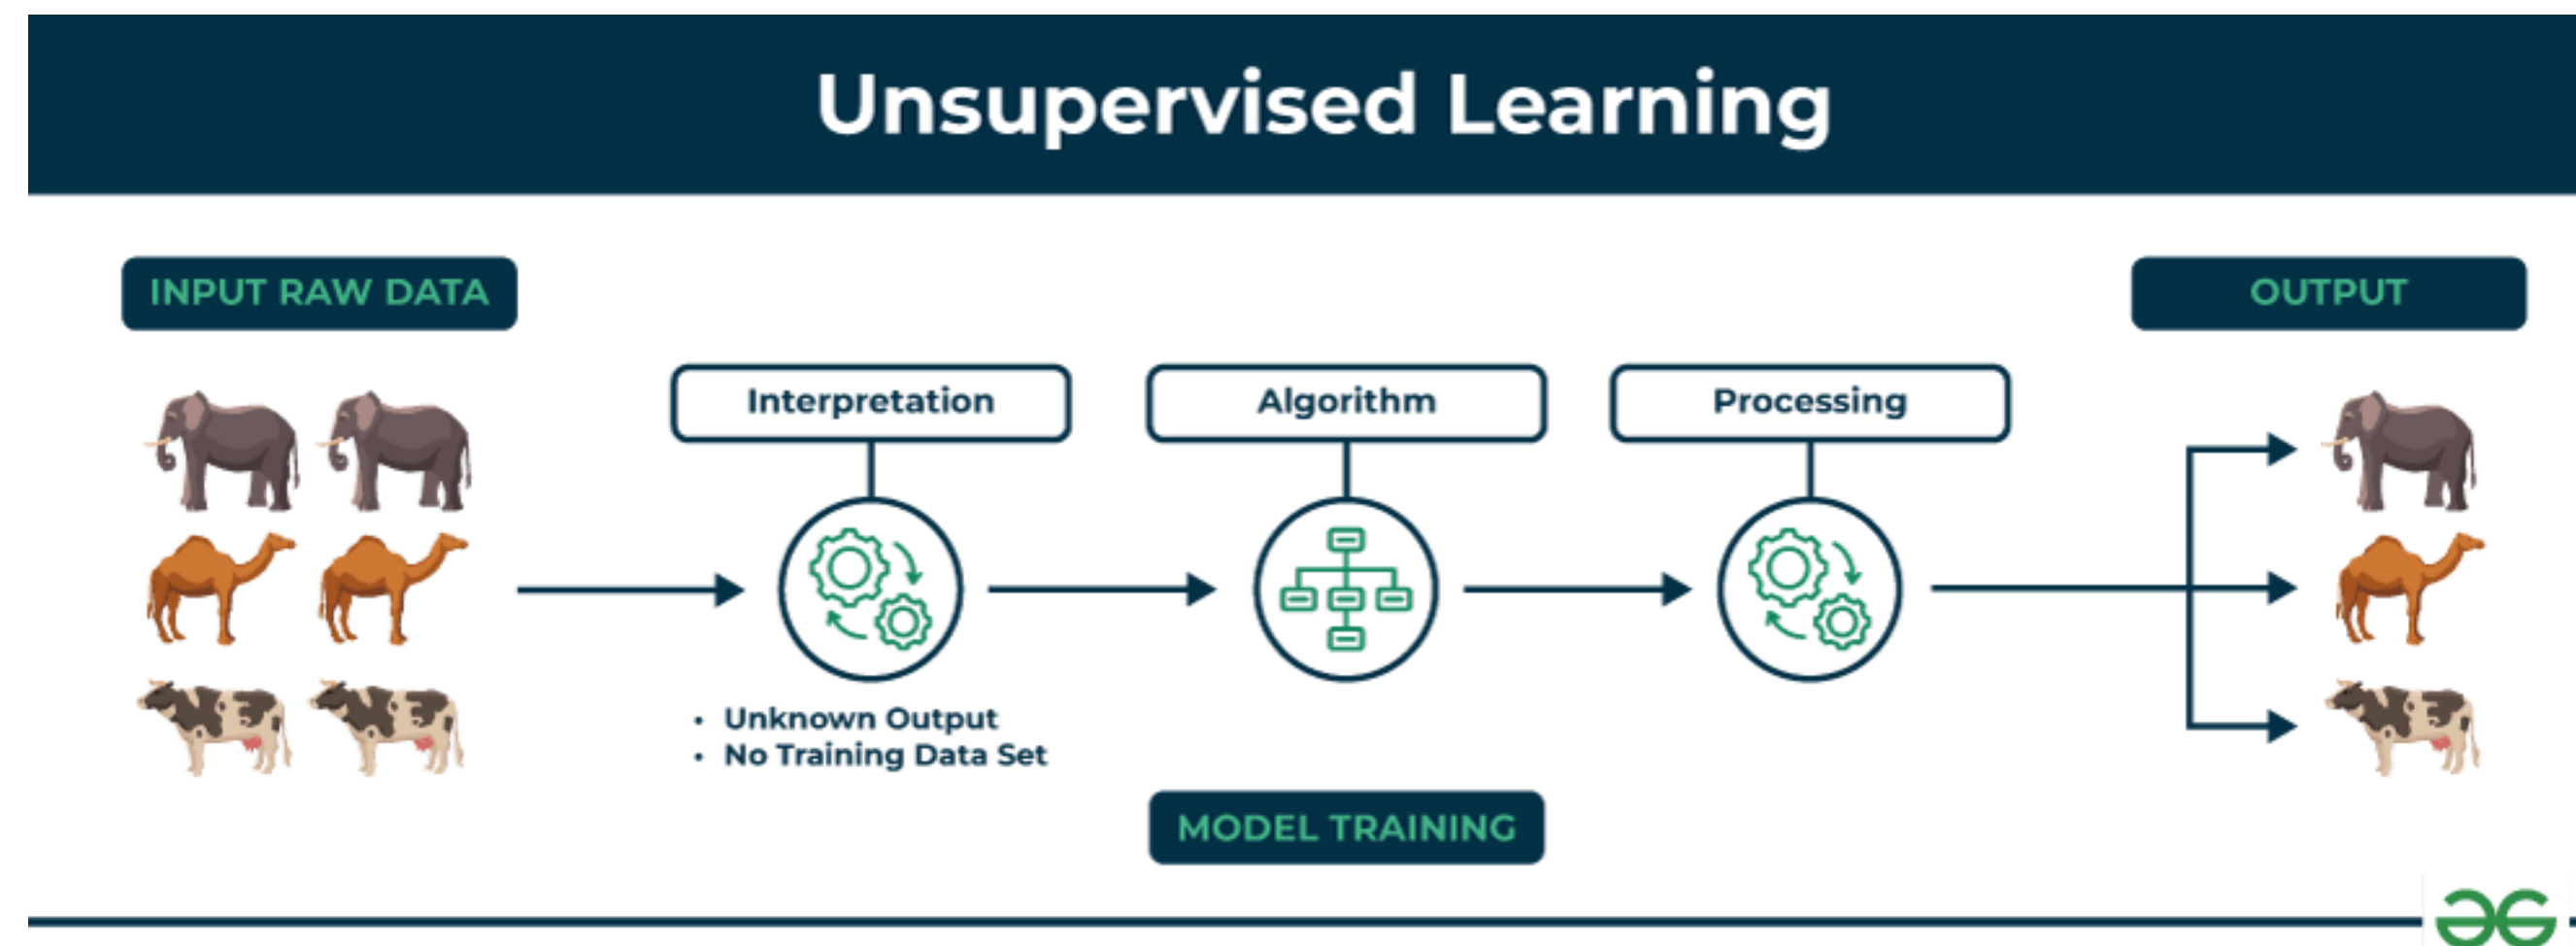

Types of Machine Learning

Supervised Learning

Unsupervised Learning

Reinforcement Learning

Supervised Machine Learning

Unsupervised Learning

Reinforcement Learning

Machine Learning Lifecycle

Exploratory Data Analysis

What is EDA?

01 Exploratory Data Analysis (EDA) is the first step in analyzing data.

02 Helps to understand the data, find patterns, and identify outliers before moving on to complex analysis.

03 Aids in choosing the right methods for further analysis by providing insights into the data's structure.

04 Helps in detecting anomalies or errors early, ensuring the quality of the data before modeling.

Step for EDA

Steps for Performing Exploratory Data Analysis

RAW DATA → CONCLUSIONS

EXPLORATORY DATA ANALYSIS (EDA)

Understand the Problem & the Data

Import & Inspect the Data

Handle Missing Data

Explore Data Characteristics

Perform Data Transformation

Visualize Data Relationships

Handling Outliers

Communicate Findings & Insights
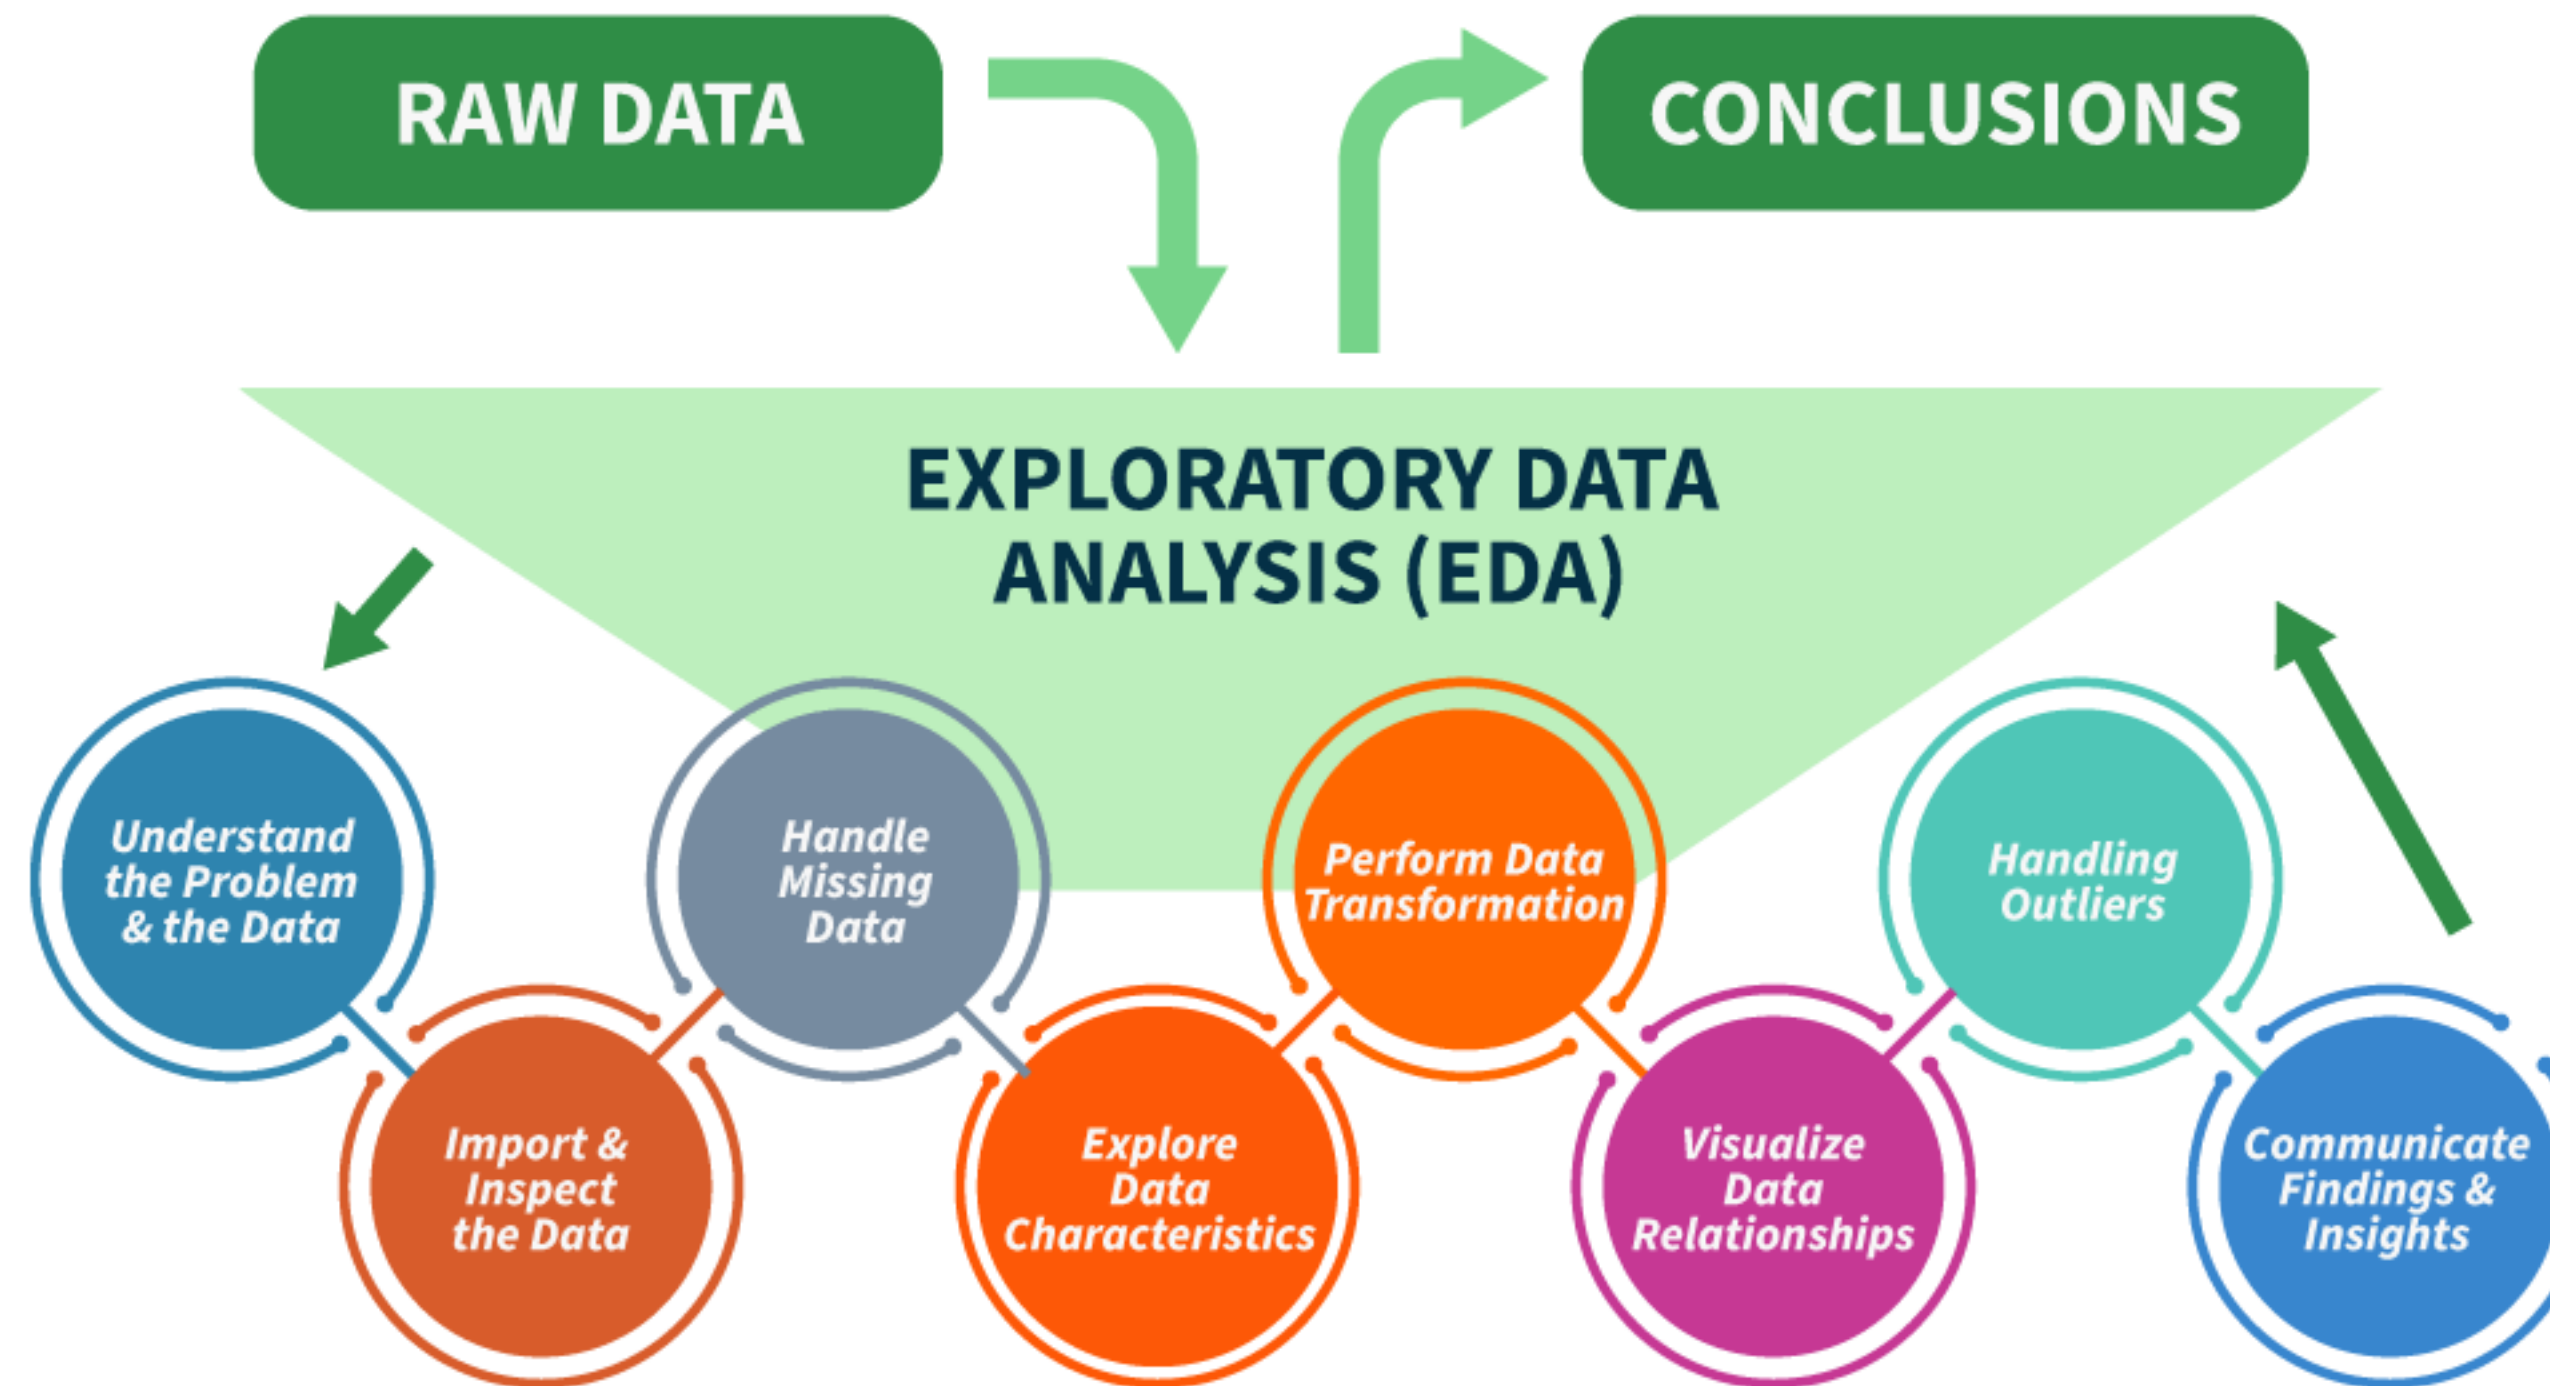

FEATURE Selection

All Features

Feature Selection

Final Features

Feature Selection is the process of selecting
the most relevant features of a dataset to use when
Building and training a machine learning model.
By reducing the feature space to a selected
subset, feature selection improves AI model performance
While lowering its computational deman

Feature Engineering

Feature Engineering

Feature engineering is the process of transforming raw data into features that are suitable for machine learning models. In other words, it is the process of selecting, extracting and transforming the most relevant features from the available data to build more accurate and efficient machine learning models.

Model Selection and Creation

Model Selection is the process of deciding which algorithm and model architecture is best suited for particular tast or dataset.

Model creation involves building and training the chosen machine learning model.

Evaluation Metrics

Evaluation Metrics are quantitative measures used to assess the performance and effectiveness of a statistical or machine learning model. These metrics provide insights into how well the model is performing and help in comparing different models or algorithms

Metrics for Classification

		Actual	
		Positive	Negative
Predicted	Positive	True Positive	False Positive
	Negative	False Negative	True Negative

Accuracy

Precision

Recall

F1-Score

Specificity

Area Under Curve

Confusion Matrix

Metrics for Regression

In the regression task, we are supposed to predict the target variable which is in the form of continuous values. To evaluate the performance of such a model below mentioned evaluation metrics are used.

Meam Absolute Error
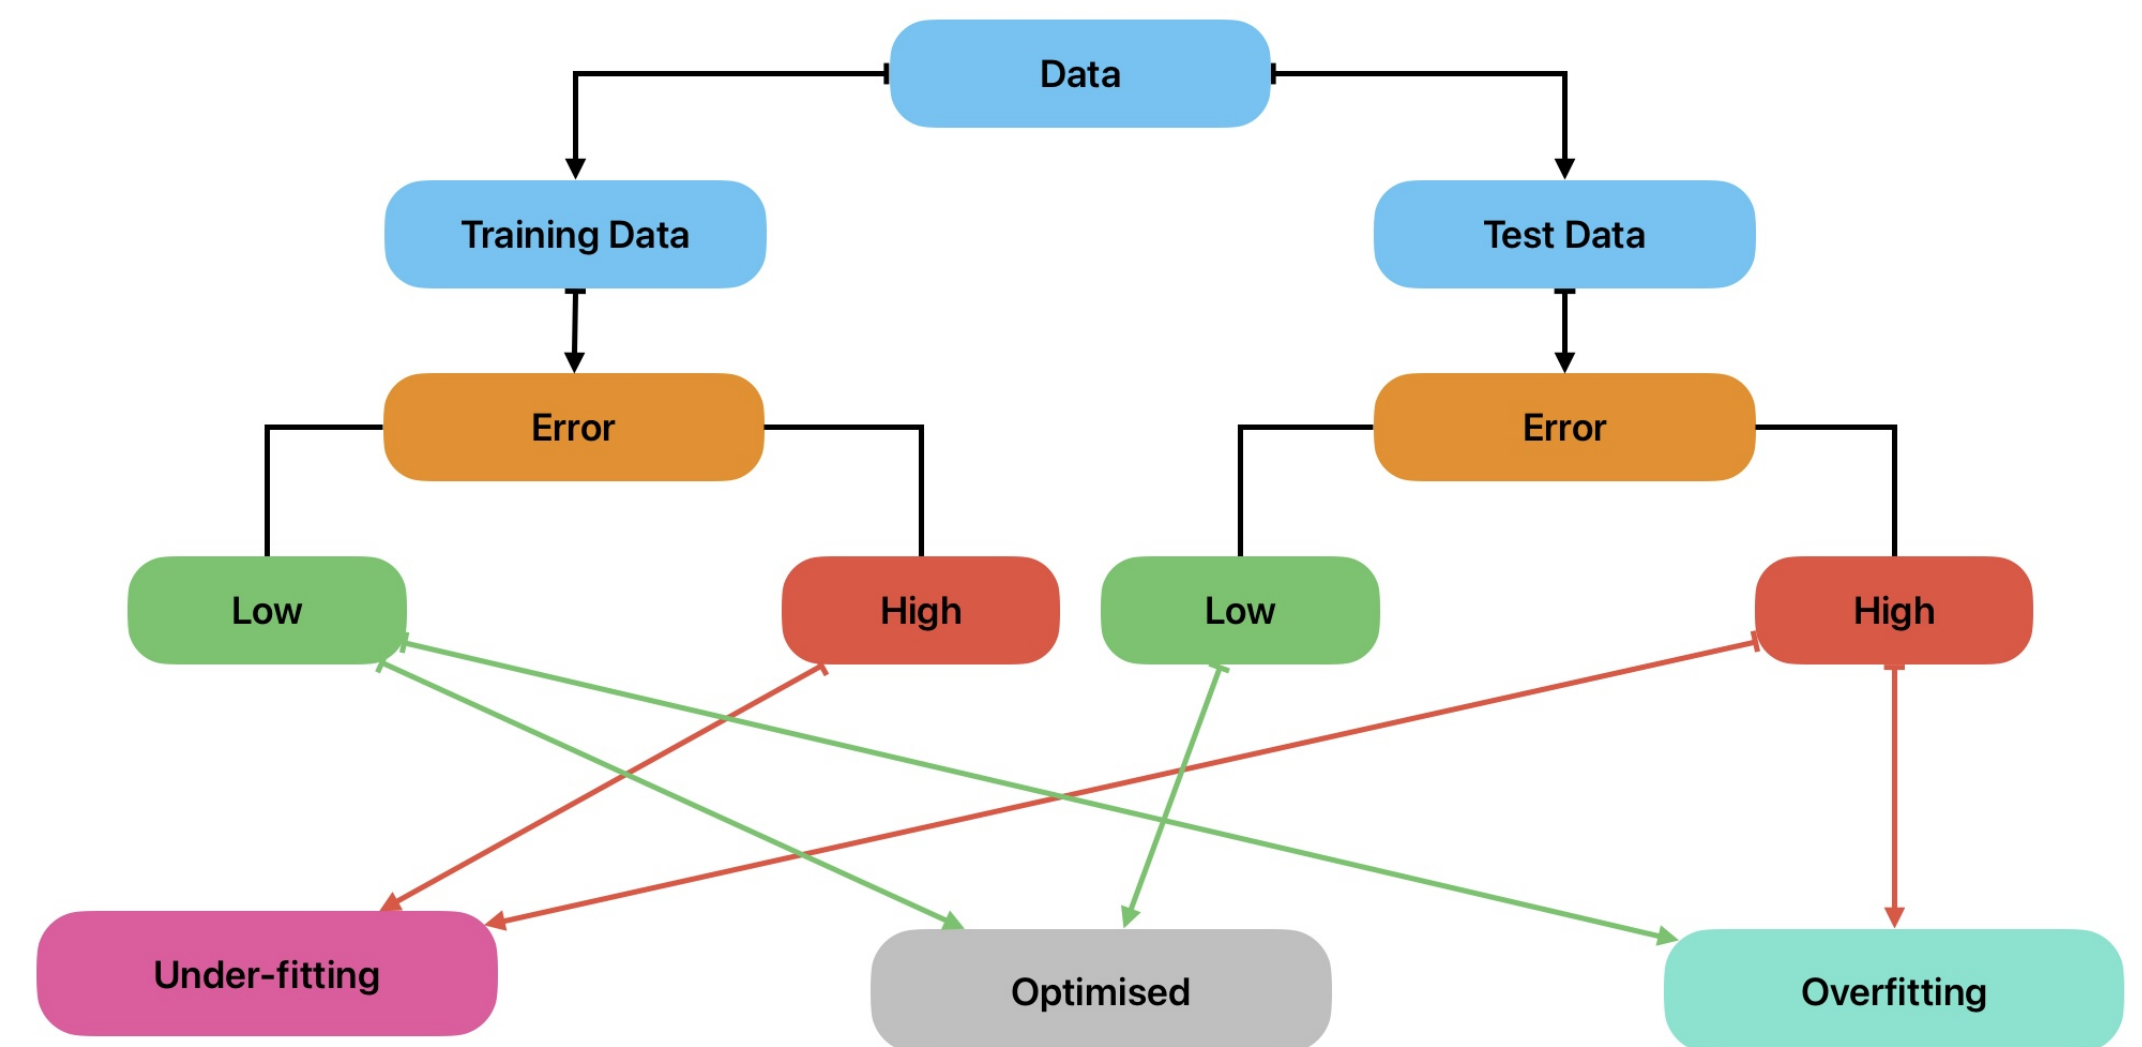

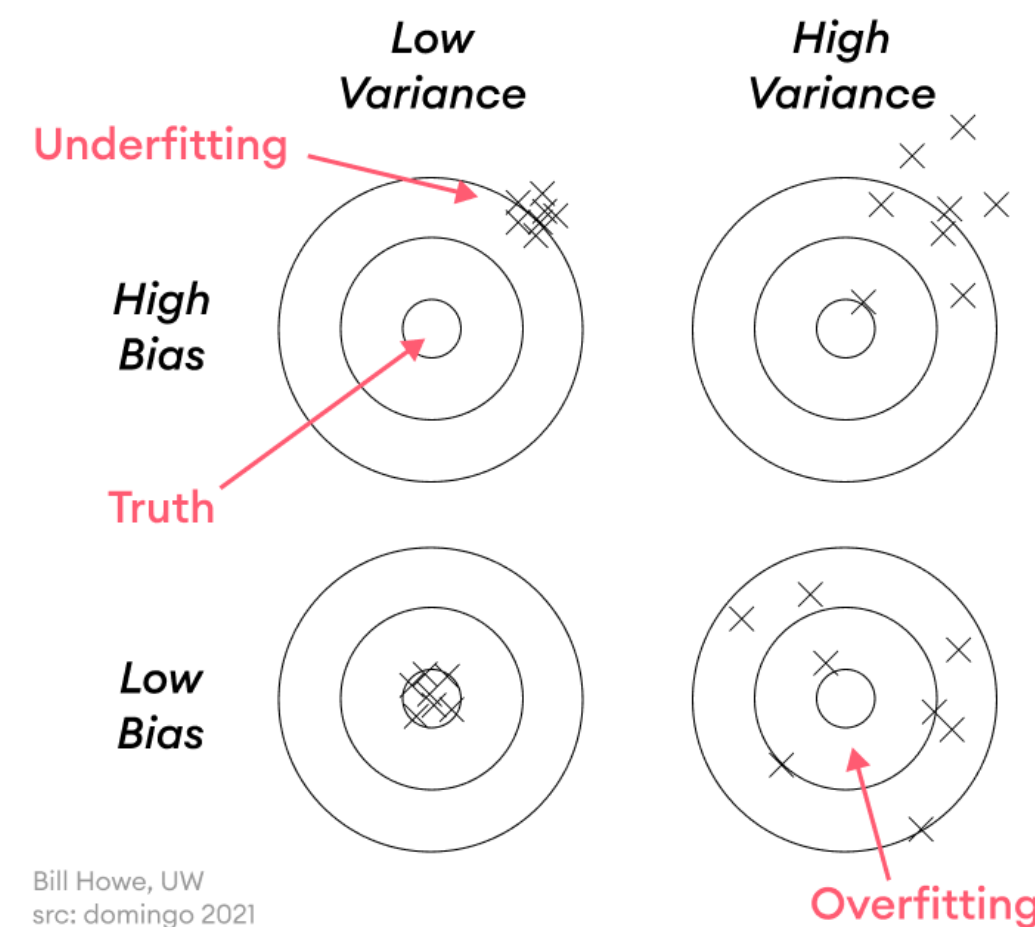

Mean Squared Error

Root Mean Square Error

Root Mean Square Logarithmic Error

R2-Score

Overfitting and Underfitting

Bias is simply defined as the inability of the model because of that there is some difference or error occurring between the model's predicted value and the actual value

Variance is the variability of the model that how much it is sensitive to another subset of the training dataset, I.e how much it can adjust on the new subset of the training dataset
